

Form C: Type Test Verification Report

Type Approval and **Manufacturer** declaration of compliance with the requirements of G98.

This form should be used when making a Type Test submission to the Energy Networks Association (ENA).

If the **Micro-generator** is **FullyType Tested** and already registered with the ENA **Type Test Verification Report** Register, the **Installation Document** should include the **Manufacturer**'s Reference Number (the Product ID), and this form does not need to be submitted.

Where the **Micro-generator** is not registered with the ENA **Type Test Verification Report** Register this form needs to be completed and provided to the **DNO**, to confirm that the **Micro-generator** has been tested to satisfy the requirements of this EREC G98.

| | | | | | ons other than the Manufacturer then that results supplied to them to verify that the | | | |

testing has been carried out by people with sufficient technical competency to carry out the tests.

Operating Range: This test should be carried out as specified in EN 50438 D.3.1.

Active Power shall be recorded every second. The tests will verify that the **Micro-generator** can operate within the required ranges for the specified period of time.

The Interface Protection shall be disabled during the tests.

In case of a PV Micro-generator the PV primary source may be replaced by a DC source.

In case of a full converter **Micro-generator**(eg wind) the primary source and the prime mover **Inverter**/rectifier may be replaced by a **DC** source.

In case of a DFIG Micro-generator the mechanical drive system may be replaced by a test bench motor.

| Maximum Impedance | R | | | Ω | | х | | | | Ω | |

Applies to three phase and split single phase Micro-generators.

^ Applies to single phase Micro-generators and Micro-generators using two phases on a three phase system.

For voltage change and flicker measurements the following formula is to be used to convert the measured values to the normalised values where the power factor of the generation output is 0.98 or above.

Normalised value = Measured value*reference source resistance/measured source resistance at test point.

Single phase units reference source resistance is 0.4 $\boldsymbol{\Omega}$

Two phase units in a three phase system reference source resistance is 0.4 $\boldsymbol{\Omega}.$

Two phase units in a split phase system reference source resistance is 0.24 Ω .

Three phase units reference source resistance is 0.24 Ω .

Where the power factor of the output is under 0.98 then the X to R ratio of the test impedance should be close to that of the Standard Impedance.

The stopping test should be a trip from full load operation.

The duration of these tests need to conform to the particular requirements set out in the testing notes for the technology under test. Dates and location of the test need to be noted below.

| Test start date | 03.December.2018 | Test end date | 04.December.2018 | | | | | | |
|---|---|---------------|------------------|--|--|--|--|--|--|
| Test location | Test location Ningbo Ginlong electrical R&D LAB | | | | | | | | |
| Power quality – DC injection: This test should be carried out in accordance with EN 50438 Appex D 3 10 | | | | | | | | | |

| Test power level | 20% | 50% | 75% | 100% | | | | | |

| Limit | >0.95 | >0.95 | >0.95 |

Protection – Frequency tests: These tests should be carried out in accordance with EN 50438 Annex D.2.4 and the notes in EREC G98 Annex A1 A.1.2.3 (**Inverter** connected) or Annex A2 A.2.2.3 (Synchronous)

| | | | - | | | | |
|-------------|-----------|------------|-----------|------------|--------------------|-----------------|--|
| Function | Se | tting | Trip | o test | "No trip tests" | | |
| | Frequency | Time delay | Frequency | Time delay | Frequency /time | Confirm no trip | |
| U/F stage 1 | 47.5 Hz | 20 s | 47.46 | 20.044s | 47.7 Hz 25 s | Yes | |
| U/F stage 2 | 47 Hz | 0.5 s | 46.95 | 0.543s | 47.2 Hz 19.98 s | Yes | |
| | | | | | 46.8 Hz 0.48 s | Yes | |
| O/F stage 1 | 52 Hz | 0.5 s | 51.96 | 0.533s | 51.8 Hz 89.98 s | Yes | |
| | | | | | 52.2 Hz 0.48 s | Yes | |

Note. For frequency trip tests the frequency required to trip is the setting ± 0.1 Hz. In order to measure the time delay a larger deviation than the minimum required to operate the projection can be used. The "No trip tests" need to be carried out at the setting ± 0.2 Hz and for the relevant times as shown in the table above to ensure that the protection will not trip in error.

Protection – Voltage tests: These tests should be carried out in accordance with EN 50438 Annex D.2.3 and
