

P300 Compatibility with $\leq 310\text{W}$ Solar Modules

Dear SolarEdge customers,

In order to support higher power installations with P300, SolarEdge have been extensively testing the product to re-qualify it for such installations.

We are happy to announce that SolarEdge Power Optimizer P300 can now be used with solar modules higher than 300W, up to 310W, supporting a wider variety of modules installations.

The compatibility between solar modules and SolarEdge optimizers depends on the maximum input voltage (@min temp), max input current, and rated input power of the solar modules.

The rated input DC power of the P300 can now be regarded as 310W (vs. 300W). See the table below for the characteristics of modules the P300 is compatible with:

| SolarEdge Power Optimizer P300 | Rated input DC power* | Max input voltage | Max short circuit current |
|--------------------------------|--|--------------------------------|---------------------------|
| | * Rated STC power of the module. Module of up to +5% power tolerance allowed | V_{oc} at lowest temperature | (I_{sc}) |
| | $\leq 310\text{W}$ | $\leq 48\text{V}$ | 11A |

The change is effective immediately and retroactive for previously manufactured P300.

Best Regards,

SolarEdge Product Marketing
